TEAM: MAYARCHIE (Maya Hawkins, Archie Barua)

PROBLEM: Bad teammates? Keep losing at videogames? Broken one too many headsets or monitors? If you need a place to take out your anger during a gaming sesh (non-destructively), we have a solution for you!

Introducing RageBear! Now you don't have to control your temper, you can simply unleash it with no consequences– with the same level of satisfaction!!! With the press of a button you can envision yourself pummeling your trash teammates. Listen to their (RageBear's) screams and watch the light leave their (RageBear's) eyes with every shake, punch, dropkick ... all powered by a handy Arduino UNO!

HOW IT WORKS: Turn on Rage Bear with a discrete button press, and watch his eyes flash red. When wakes up (his eyes glow white), then he's ready for action! Punch him, throw him, shake him, or even give him a hug, Rage Bear will give you that feedback that you need through his vibration sensor. You can hear him scream through the Piezo, or watch the light leave his (LED) eyes with every action based on how much the sensor is activated!

INPUT:
Button, Vibration Sensor
OUTPUT:
Piezo,(2) RGB LED
